2000 L Street NW, Suite 710 Washington, DC 20036 Tel: 202-296-7449 Fax: 202-296-7442 Email: GEMI@worldweb.net http://www.gemi.org

## About the Global Environmental Management Initiative

The Global Environmental Management Initiative (GEMI) is a non-profit organization of leading companies dedicated to helping business achieve environmental, health and safety excellence. Through the collaborative efforts of its members, GEMI promotes a worldwide business ethic for environmental management and sustainable development through example and leadership. GEMI's member companies as of March 1996 are:

AT&T AlliedSignal Inc. Anheuser-Busch Companies Apple Computer, Inc. **Bristol-Myers Squibb Company Browning-Ferris Industries** Ciba-Geigy Corporation The Coca-Cola Company Colgate-Palmolive Company Coors Brewing Company **Digital Equipment Corporation** The Dow Chemical Company Duke Power Company The DuPont Company Eastman Kodak Company Florida Power & Light Georgia-Pacific Corporation Halliburton Company **Hughes Electronics Corporation** Johnson & Johnson Merck & Company, Inc. Olin Corporation The Procter & Gamble Company The Southern Company Tenneco Union Carbide Corporation WMX Technologies, Inc.

## Acknowledgments

This checklist was developed under the auspices of the Tools Work Group, chaired by Michael T. Fisher of The Procter & Gamble Company. This project was directed by Vivian Pai of Johnson & Johnson.

Representatives from several GEMI members companies participated in the preparation of this document. Most notably, the primary authors of the document are:

Clinton Allen, Bristol-Myers Squibb Company Paul Cullen Beatley, Environmental Policy Centre Europe Thierry Dumortier, Environmental Policy Centre Europe Michael Fisher, The Procter & Gamble Company Mark Harvey, Georgia-Pacific Corporation Patricia Hintzel, Tenneco Michele Malloy, Tenneco Jennifer Olha, Environmental Policy Center Vivian Pai, Johnson & Johnson Maria Rasmussen, Eastman Kodak Company John Stier, Anheuser-Busch Companies

The work group also received generous input and support from others, including:

Tom Laboon, Environmental Policy Center Ken Millian, GEMI Executive Director Rob Minter, The Southern Company George Nagle, Bristol-Myers Squibb Bill Sugar, Anheuser-Busch Companies Vicki Sullivan, Southern Company Services Clarice Taylor, Colgate-Palmolive Company

In addition, Judy Hoffman of Weadon Progressive Printing provided design and printing services.

## Disclaimer

The guidance in this checklist is based on the Draft International Standard ISO 14001, dated August 1995, and the professional judgment of the individual collaborators listed in the Acknowledgments. The comments incorporated in the primer are those of the individual collaborators and not necessarily their organizations.

The development and publication of this checklist does not, in any manner, advocate or endorse the approval, content, or registration of the ISO 14001 standard by GEMI or its member companies.

Neither GEMI, nor the Law Companies Environmental Policy Center, nor the Law Companies Environmental Policy Centre Europe are responsible for any form of damage that may result from the application of the guidance contained in this document.

### NOTE: On November, 2000 this document was revised to reflect the numbering scheme of the final standard – ANSI/ISO 14001-1996

## ISO 14001 Environmental Management System Self-Assessment Checklist

### PURPOSE OF THIS CHECKLIST

This checklist and primer has been developed to improve facility managers' understanding of the requirements and elements of the environmental management system outlined in the ISO 14001 draft international standard. It is designed to allow for a rapid self-assessment of an organization or facility to determine how closely existing management practices and procedures correspond to the elements of the standard. The criteria of the draft standard have been rephrased in the format of a simple questionnaire, with a three-part scoring system, as explained in this document. In addition to a brief guide to self-scoring, a fuller description of what is required by the standard's criteria is included in the appendix. In this format, even with limited background knowledge of the ISO 14001 standard, a facility or other business manager can quickly review existing operations to determine how they measure up to the standard. This in turn can serve as the starting point of a "gap analysis" to identify management tools or system elements that might usefully be implemented in the organization to help improve overall environmental performance.

### INTRODUCTION

Representatives from some fifty countries around the globe have recently agreed to the draft international standard (DIS) on environmental management systems (ISO/DIS 14001) issued by the International Organization for Standardization (ISO). It is expected that the standard will be formally adopted in 1996. It is intended that the implementation of an environmental management system (EMS) based on this standard will result in improved environmental performance. The standard is based on the concept that the organization will periodically review and evaluate its environmental management system in order to identify opportunities for improvements in environmental performance. When the ISO standard is formally adopted, it is anticipated that existing national EMS standards, such as BS 7750 (UK), IS 310, (Ireland), NF X30-200 (France) and UNE 77-801(2)-94 (Spain) will be withdrawn and replaced by the single international EMS standard. Adoption by the European Council of ISO 14001 as the standard to implement Council Regulation EEC/1836/93 on a Community Environmental Management and Audit Scheme (EMAS) is not yet decided.

### Why introduce an environmental management system?

The environment has become an important factor in the decision-making process of companies around the world. Environmental issues are becoming more complex and interconnected. Traditional ways of addressing environmental issues in a reactive, ad-hoc, end-of-pipe manner - are proving to be highly inefficient. As competition increases within the expanding global market, environmental laws and regulations are setting new standards for business in every region of the world. But good environmental performance is not just a legal or moral obligation. It also makes good business sense. Reducing pollution means increasing efficiency and wasting fewer resources. Improved health and safety conditions result in a more productive workforce. Supplying goods and services that respect the environment helps to expand markets and improve sales. In short, companies become more competitive when they practice good environmental management. On the other hand, the risks posed by mismanaging environmental issues are complex and varied. They include the obvious, such as damage to the environment with negative consequences for the overall standard of living. They can also include damage to a company's reputation and a resulting loss of confidence among customers, neighbors and shareholders, the loss of market share, and, of course, legal liabilities.

Such risks cannot be dealt with on an ad-hoc basis. As with any financial or commercial risk, only a well-founded and properly implemented management approach can provide a measure of confidence that good performance is not an accident and that poor performance can be identified and rectified. By properly implementing an appropriate environmental management system (EMS), any company, large or small, can ensure that they effectively manage environmental risks while identifying and exploiting the myriad opportunities proper environmental management can bring. Such a systematic approach to environmental management is at the very heart of the ISO 14001 standard. This checklist is intended to allow managers of industrial facilities to review existing operations and management approaches against this standard to determine how well they measure up to what is soon to be considered as "state-of-the-art" in effective approaches to environmental management.

### **ELEMENTS OF ISO 14001**

ISO/DIS 14001 is one of a series of emerging international environmental management standards aimed at promoting continual improvement in company environmental performance through the adoption and implementation of an environmental management system. The (draft) standard specifies the core elements of an EMS, but contains only those elements that may be objectively audited for certification or self-declaration purposes. A companion guidance standard, ISO/DIS 14004 includes examples, descriptions and options that aid in the implementation of an EMS and in integrating the EMS into overall management practices. It is not intended for use by certification/registration bodies.

ISO/DIS 14001 defines an overall environmental management system, closely modeled on the ISO 9000 quality systems standard, and covers the following key elements:

- Establishment of an appropriate environmental policy that is documented and communicated to employees and made available to the public, and which includes a commitment to continual improvement and pollution prevention, regulatory compliance and a framework for setting objectives;
- A planning phase that covers the identification of the environmental aspects of the organization's activities, identification and access to legal requirements, establishment and documentation of objectives and targets consistent with the policy, and establishment of a program for achieving said targets and objectives (including the designation of responsible individuals, necessary means and timeframes);
- **Implementation and operation of the EMS** including the definition, documentation and communication of roles and responsibilities, provision of appropriate training, assurance of adequate internal and external communication, written management system documentation as well as appropriate document control procedures, documented procedures for operational controls, and documented and communicated emergency response procedures;
- Checking and corrective action procedures, including procedures for regular monitoring and measurement of key
  characteristics of the operations and activities, procedures for dealing with situations of non-conformity, specific record
  maintenance procedures and procedures for auditing the performance of the EMS;
- Periodic management reviews of the overall EMS to ensure its suitability, adequacy and effectiveness in light of changing circumstances.

The EMS as outlined in ISO 14001 provides a structured process for the achievement of continual improvement, the rate and extent of which is determined by the organization in light of economic and other circumstances. Although some improvement in environmental performance can be expected due to the adoption of a systematic approach, it should be understood that the EMS is a tool which enables the organization to achieve and systematically control the level of environmental performance that it sets itself. The establishment of an EMS will not, in itself, necessarily result in an immediate reduction of adverse environmental impact. Indeed, care needs to be taken that the mere establishment of an EMS does not lull the organization into a false sense of security. But effectively used, an EMS should enable an organization to improve its environmental performance and avoid or reduce adverse environmental impacts over time.

An organization has the freedom and flexibility to define the boundaries of its system and may choose to implement an EMS throughout the entire organization, or within specific operating units or activities of the organization. If it is implemented for a specific operating unit or activity, policies and procedures developed by other parts of the organization can be used to meet the requirements of an environmental management system, provided that they are applicable to the specific operating unit or activity that will be subject to the environmental management system. The level of detail and complexity of the environmental management system, and resources dedicated to it will be dependent on the size of the organization and the nature of its activities. This may be the case in particular for small and medium-sized enterprises.

Integration of environmental matters with the overall management system can contribute to the effective implementation of the environmental management system, as well as to the efficiency and clarity of roles.

In many aspects, the ISO 14001 standard shares common management system principles with the ISO 9000 series of quality system standards. In the beginning of the ISO 14001 standard, it states that "organizations may elect to use an existing management system consistent with the ISO 9000 series as a basis for its environmental management system. It should be understood, however, that the application of various elements of the management system may differ due to different purposes and different interested parties. While quality management systems deal with customer needs, environmental management systems address the needs of a broad range of interested parties and the evolving needs of society for environmental protection."

### **Related Standards Under Development**

The ISO 14000 family of standards also includes other draft standards related to environmental management systems that will soon be available for trial. These include standards on environmental auditing and related environmental investigations, environmental labeling, environmental performance evaluation, life-cycle assessment, terms and definitions and environmental aspects in product standards.

### HOW TO USE THIS CHECKLIST

On the following pages are a series of questions to identify to what extent your environmental management system is complete in comparison to the requirements set in the ISO 14001 standard.

To facilitate answering the questions, there is a table beneath each question with three columns of examples. Each column corresponds to a score. The examples in the first column illustrate a situation which does not comply at all with the requirement and has the score "0". The examples in the second column illustrate a situation where the requirement is more or less fulfilled, but where there is still room for improvement and a score "1" applies. Finally in the third column, the examples illustrate a situation in which the requirement appears to be completely fulfilled and a score "2" applies.

### How to Score

It is possible to calculate a score by using one of two methods. In the first method, you should begin with the first column to determine if the situation described therein accurately reflects the situation in your organization or facility. If not, then proceed to the second column and make the same decision. Eventually, move on to the third column and ask the same questions. In this way, you "build" progressively on your score.

0	1	2
<ul> <li>Verify whether one of the paragraphs in this box is applicable to the situation in your organization.</li> <li>&gt; If this is the case, your score for this question will be "0".</li> <li>&gt; If this is not the case, proceed in next column.</li> </ul>	<ul> <li>Verify whether any of the statements in this box is applicable to the situation in your organization.</li> <li>If this is the case, your score for this question will be at least "1".</li> <li>Proceed to the next column, to verify whether your score is even better or to identify the areas where you could improve your environmental management system.</li> </ul>	<ul> <li>Verify whether your organization conforms with <i>all</i> the paragraphs in this box.</li> <li>If this is the case, your score for this question will be "2". Congratulations, you successfully implemented this aspect of the environmental management system.</li> <li>If this is not the case, your score remains "1". You have identified an area where your environmental management system can be improved.</li> </ul>
management system elemen	n a) the adequacy and comprehensiveness of the ts currently in place and b) management system g improvement that the organization will require	
		Score:

Write your score in the space provided, and note any comments or observations in the appropriate space (e.g., any actions to be taken to improve situation or score.) Alternatively, a process of elimination can be used. In this case, begin with the third column and determine whether all or some of the situations described apply to your organization. If all statements apply, give your organization a "2". If none, or only some, of the statements apply, move then to the middle column. If any of these statements apply to your organization, then assign a score of "1". If none of these statements apply, then assign a score of "0".

### **EVALUATION OF YOUR FINAL SCORE**

This checklist contains a total of 31 questions in five different sections, corresponding to the five guiding principles listed in the ISO 14004 standard. A perfect score of "62" (i.e., every question received a score of 2) would, if responded to thoroughly and honestly, indicate that the organization has all of the requisite EMS elements and procedures called for in the draft standard, sufficiently implemented to adhere to the standard.

A score of "0" would likely seldom, if ever, occur, since even the most rudimentary elements of mere legal compliance would normally oblige the use of a minimum of management practices. It is important to bear in mind that how well an organization implements the standard's requirements is not the level of performance achieved using the standard, but the completeness and adequacy of the procedures and systems established to achieve that performance. Thus, for example, the mere fact that all employees are currently aware of their environmental responsibilities is insufficient under the terms of the standard. This could actually be a "chance" situation in the absence of defined and documented procedures to ensure that all employees (current and future) are made aware of these responsibilities.

For ease of interpreting scores, we have broken down the standard into its principle elements and have established a rating system based on three ranges of possible score for each, as follows.

### **Principle 1: Commitment and Policy**

Score 0-5	The organization either has no environmental policy, or its policy lacks most of the key elements, such as a commitment to continual improvement, required to fulfill the terms of the standard.
Score 6-10	The organization has an environmental policy that meets many, but not all, of the requirements established under the standard.
Score 11-14	Top management has established and documented an environmental policy that meets most, if not all of the criteria laid down in the standard. This policy takes into account most, if not all, of the environmental aspects and is well communicated, both inside and outside of the organization. However, if the policy is not appropriate to the nature, scale and environmental impacts of the organization's activities, products or services, subsequent development of the EMS might be compromised.

### **Principle 2: Planning**

- Score 0-3 The organization has focused little, if any effort on identifying its relevant environmental aspects and setting achievable objectives and targets; its environmental management program is insufficient to implement the environmental policy.
- Score 3-6 The organization has made progress in identifying most of its environmental aspects as well as the legal requirement to which it is subject, and might have established some objectives and targets which its environmental management program is designed to achieve, but much progress is still required.
- Score 6-10 Most, if not all, of the required procedures exist to identify how its activities, products and/or services impact the environment, and to keep up to date on changing regulations. Measurable targets and objectives have been set for most, if not all appropriate levels of the organization; an action program exists to ensure their attainment. On the other hand, if clear, documented targets and objectives have not been established on the basis of a fairly complete identification of all environmental aspects of the business, its environmental action program may well overlook certain key issues of concern.

### **Principle 3: Implementation and Operation**

- Score 1-8 Existing procedures do not fully take into account all environmental aspects at all levels and activities of the organization. Specific responsibilities and accountabilities might not be sufficiently communicated throughout the organization. Sufficient resources and technical competencies might yet be lacking.
- Score 9-18 Many procedures to achieve the policy's objectives and targets exist, but they might not include emergency situations. Responsibilities and accountabilities for their implementation have been assigned for the most part, and much, but not all of the needed resources requirements have been made available.
- Score 19-26 Most, if not all, areas of responsibility have been assigned, and resources allocated. Operating and other procedures have been developed, documented and communicated. Personnel are trained in their use and in complying with their environmental responsibilities. Document controls exist to ensure that systems are kept up to date. But, if operations and activities associated with or causing significant environmental aspects have not been identified (see Principle 2) or if documented procedures have not been established to ensure that they are performed in accordance with the environmental policy, implementation will not meet the terms of this standard

### **Principle 4: Checking and Corrective Action**

- Score 1-3 Few, if any procedures have been developed or implemented for checking the performance of the EMS and its component elements; and thus, areas of non-conformance cannot be adequately identified; as a result, corrective or preventive measures cannot be effectively taken.
- Score 4-7 The organization has established many of the measurement and evaluation procedures required by the standard, and might have some of the key elements for dealing with situations of non-conformity. Some important records are maintained, and EMS audits might be carried out. However, much improvement is still warranted to conform to the standard.
- Score 8-10 The organization has implemented the majority of procedures and programs described in the standard to effectively and regularly monitor and measure the applicable characteristics of operations and activities, as well as to detect and correct areas of non-conformity. Adequate procedures exist for management of most, if not all, appropriate records, and a regular EMS audit program has been established. Even with a high score, however, the overall performance in meeting these criteria will be placed in serious doubt if the organization does not have a program and documented procedures for periodic audits of the EMS, which are adequate to ensure that conformity with policies, objectives and targets is indeed systematic, and not accidental

### **Principle 5: Management Review**

Since there is only one question in this section, your score for the question posed will give an adequate indication of your score for the section. In any event, the organization cannot substantively fulfill this requirement if it does not periodically review the basic assumptions upon which its EMS is based.

### **Overall Score**

A high score in any section is not necessarily a sign that the requirement is essentially met, if the core key criteria in that section is not met. Moreover, because all principles and elements are closely interlinked, a low score in any given section could place in doubt the higher scores achieved elsewhere. On the other hand, scoring at least 1 or 2 in each question should give the organization the confidence that its management approaches are compatible with the EMS as described in ISO 14001.

### 4.2 Environmental Policy Principle 1: Commitment and Policy

"The environmental policy is the driver for implementing and improving the organization's environmental management system."

### 4.2 HAS TOP MANAGEMENT **ENVIRONMENTAL POLICY?**

THE **ORGANIZATION'S** DEFINED

0	1	2
Top management has not defined an environmental policy yet.	An environmental policy was issued, but it is not clear that it was defined and endorsed by top management.	Top management has defined the organization's environmental policy in a written document and made it public.
	The environmental policy has not been defined within the context of the environmental policy of the broader corporate body (if any) of which the organization is a part, and has not received the endorsement of that body ( <i>see Annex A to the Standard, A.4.2</i> ).	The environmental policy has been defined and documented within the context of the environmental policy of the broader corporate body (e.g., the parent company or other overall organization, if any) and has the endorsement of that body ( <i>see Annex A to the Standard, A.4.2</i> ).
Comments:		
		Score:

## **4.2. A IS THIS ENVIRONMENTAL POLICY APPROPRIATE TO THE NATURE, SCALE AND ENVIRONMENTAL IMPACTS OF ITS ACTIVITIES, PRODUCTS OR SERVICES?**

0	1	2
The environmental policy was not developed with a view to the nature, scale or impacts of activities, products or services.	The organization has an environmental policy which partially reflects the nature, scale and environmental impacts of its activities, products or services. The policy reflects broadly the nature, scale and environmental impacts of the organization's activities or products or services, but not all three.	The organization has consciously examined the nature and scale of its activities, products and services. The policy is periodically reviewed and revised to reflect changing conditions and information concerning the nature, scale and environmental impacts of its activities, products and services. The areas of application of the policy are clearly identifiable ( <i>see Annex A to</i> <i>the Standard, A.4.2</i> ).
Comments:		

Score:

## 4.2.B DOES THE ENVIRONMENTAL POLICY INCLUDE A COMMITMENT TO CONTINUAL IMPROVEMENT AND PREVENTION OF POLLUTION?

0	1	2
The environmental policy does not include a clear commitment to continual improvement and prevention of pollution.	The environmental policy does not commit to both continual improvement and prevention of pollution, but only commits to one of these.	The environmental policy contains a clear commitment to pursue continual improvement in environmental performance by putting in place an effective environmental management system.
		The policy commits to the prevention of pollution.
Comments:		

Score: \_\_\_\_

### 4.2.C DOES THE ENVIRONMENTAL POLICY INCLUDE A COMMITMENT TO COMPLY WITH RELEVANT ENVIRONMENTAL LEGISLATION AND REGULATIONS, AND TO OTHER REQUIREMENTS TO WHICH THE ORGANIZATION SUBSCRIBES ?

0	1	2
0 The environmental policy does not include a commitment to comply with relevant environmental legislation and regulations, or to other requirements to which the organization subscribes. Comments:	1The environmental policy includes a commitment to comply with relevant environmental legislation and regulations, but does not mention any commitment to any other requirements to which the organization subscribes.The policy includes a commitment to adhere to or comply with other requirements to which the organization subscribes (e.g. "Responsible Care") but does not explicitly commit the organization to comply with relevant legislation.	2 The environmental policy includes a clear commitment to comply with relevant environmental legislation and regulations, as well as to all other requirements to which the organization subscribes (such as the ICC Business Charter for Sustainable Development, for example).
		Score:

### 4.2.D DOES THE ENVIRONMENTAL POLICY PROVIDE THE FRAMEWORK FOR SETTING AND REVIEWING OF ENVIRONMENTAL OBJECTIVES AND TARGETS?

0	1	2
The environmental policy is not specific enough to guide the setting of environmental objectives and targets. The policy has been written in such a way that may leave its readers confused as to its overall goals and objectives. The policy does not specify any commitments.	The environmental policy is specific enough to guide the setting of environmental objectives and targets in many of the environmental aspects of relevance to the organization. It does not, however, provide sufficient guidance with regard to all key environmental aspects. Overall, the environmental policy is sufficiently clear as to be capable of being understood by most interested parties, but there are some portions that might be misunderstood or which have caused confusion.	The environmental policy is clear and specific enough to guide the setting of environmental objectives and targets. The policy is sufficiently clear to be capable of being understood by interested parties, including those responsible for reviewing environmental targets and objectives.
Comments:		
		Score:

## 4.2.E IS THE ENVIRONMENTAL POLICY DOCUMENTED, IMPLEMENTED AND MAINTAINED, AND COMMUNICATED TO ALL EMPLOYEES ?

0	1	2
The environmental policy has not been documented (i.e., in written or electronic form) or communicated to all employees. No provisions have been made by management for the maintenance or implementation of the environmental policy (e.g., top management have not designated a specific management representative with defined responsibility and authority for implementing the environmental management system of which the policy forms a part). Comments:	The environmental policy has been documented, but it has not been communicated to all employees (e.g. there is no procedure to ensure that new employees receive a copy of the environmental policy). There is no procedure to ensure the environmental policy is regularly reviewed and adapted to the changed perceptions and circumstances (i.e., maintained).	The environmental policy has been documented and it is communicated to all employees. All new employees receive a copy of the environmental policy. The environmental policy is regularly reviewed and adapted to the changed perceptions and circumstances.

Score:

### 4.2.F IS THE ENVIRONMENTAL POLICY AVAILABLE TO THE PUBLIC ?

0	1	2
The environmental policy is not made available to the public.	The environmental policy is made available to some members of the public (provided, for example, the public affairs or legal department approve its dissemination).	The environmental policy is freely available to any member of the public who requests it. Any amendments or modifications to the policy are also made available to the public.
Comments:		uie puone.

Score: \_

### 4.3 Planning Principle 2: Planning

"An organization should formulate a plan to fulfill Its environmental policy."

4.3.1.A. Is there a procedure to identify the environmental aspects of your business over which you have control or influence and to determine actual or potential significant impacts on the environment?

the environmental aspects of the business.environmental aspects of the activities, products or services over which the organization has control or influence, but not all three.significant environmental aspects o business, including activities, prod and services and it has been detern which of the environmental aspects have or can have a significant impact on the environment (Note: information already developed for regulatory or other purposes may be used in this process).significant environmental aspects out not all three.If the organization does not have an existing environmental management system, it has not conducted a review to establish its current position with regard to the environment ( <i>see Annex A</i> to the Standard, A.4.3.1).The organization does not keep information regarding its environmental aspects up to date.The analysis of significant environmental aspects of the	0	1	2
inputs and outputs associated with current and relevant past activities, products and services ( <i>see Annex A</i> <i>the Standard</i> , A.4.3.1).	the environmental aspects of the business.	<ul> <li>environmental aspects of the activities, products or services over which the organization has control or influence, but not all three.</li> <li>Existing procedures are insufficient to determine which environmental aspects have or can have a significant impact on the environment (Note: information already developed for regulatory or other purposes may be used in this process).</li> <li>If the organization does not have an existing environmental management system, it has not conducted a review to establish its current position with regard to the environment (<i>see Annex A to the Standard, A.4.3.1</i>).</li> <li>The organization does not keep information regarding its</li> </ul>	significant impact on the environment. If the organization did not have an existing environmental management system, its first step in this process was to establish its current position with regard to the environment by means of a review ( <i>see Annex A to the</i> <i>Standard, A.4.3.1</i> ). The process for identifying significant environmental aspects takes into account the cost and time of undertaking the analysis and the availability of reliable data ( <i>see Annex</i> <i>A to the Standard, A.4.3.1</i> ). The analysis of significant environmental aspects of the organization takes into account the inputs and outputs associated with its current and relevant past activities, products and services ( <i>see Annex A to</i>

## **4.3.1.B.** ARE ASPECTS RELATED TO THESE SIGNIFICANT IMPACTS CONSIDERED IN SETTING ENVIRONMENTAL OBJECTIVES?

0	1	2
The process of setting environmental objectives was not, or does not, take aspects related to significant environmental impacts into consideration.	The process of setting environmental objectives has taken or takes into consideration aspects related to significant environmental impacts for activities or products or services, but not all three. (Note: the organization may take into account the degree of practical control it may have over the environmental aspects being considered).	The process of setting environmental objectives has taken or takes into consideration aspects related to significant environmental impacts related to its activities, products and services.
Comments:		

Score: \_\_\_\_

### 4.3.2 DO YOU HAVE A PROCEDURE TO IDENTIFY AND HAVE ACCESS TO LEGAL REQUIREMENTS APPLICABLE TO THE ENVIRONMENTAL ASPECTS OF YOUR ACTIVITIES, PRODUCTS OR SERVICES ?

0	1	2
There is no documentation on environmental legislation and regulations applicable to the organization, nor of the other environmental requirements to	There is a procedure to identify all legal requirements that are applicable to the environmental aspects of the organization's activities or products or services, but not all three	There is a procedure to systematically identify all new legal requirements that apply to the environmental aspects of the organization's activities, products or services.
which the organization subscribes. No procedure exists to ensure that the organization will identify and access all new and modified legal or other requirements applicable to activities, products or services.	Procedures exist to identify and access most legal and other requirements, but not all. Procedures exist to identify, access and update information relative to the non- regulatory environmental programs to which the organization subscribes, but not the legal requirements.	The procedure also systematically identifies modifications to existing legal and other requirements. The procedure ensures access to all existing, new and modified legal requirements. The procedure also ensures identification, access and updating of other, non-regulatory requirements to which the organization subscribes.
Comments:		

### 4.3.3 HAVE ENVIRONMENTAL OBJECTIVES AND TARGETS BEEN ESTABLISHED AND DOCUMENTED AND ARE THERE PROCEDURES FOR MAINTAINING THESE DOCUMENTS?

0	1	2
No environmental objectives and targets have been established by the organization. No environmental policy has been established.	Environmental objectives and targets have been established by the organization, but not documented. The environmental objectives and targets were not established with consideration of legal or other requirements, significant environmental aspects, technological options, or interested parties. No procedure exists to ensure that these objectives and targets are reviewed and maintained regularly. Environmental objectives and targets have been established and documented but do not cover each and every relevant function and level within the organization. Targets and objectives include consideration of end-of-pipe technological options and compliance with legal and other requirements, but do not reflect a commitment to pollution prevention. Targets and objectives take into consideration the organizations' financial, operational and business requirements but not the views of interested parties.	Environmental objectives and targets have been developed at each relevant function and level within the organization. The objectives are specific and the targets are measurable wherever practicable. The objectives and targets are consistent with the environmental policy and reflect a commitment to pollution prevention. The objectives and targets are in alignment with the significant environmental impacts associated with the organization's activities, products or services. The organization has taken into consideration, when establishing (and reviewing) its objectives, legal and other requirements, technological options, financial, operational and business requirements, as well as the views of interested parties. There is a procedure to ensure the objectives and targets are reviewed and updated regularly.
Comments:		

Score:

### 4.3.4 HAS AN ENVIRONMENTAL MANAGEMENT PROGRAM FOR ACHIEVING THE OBJECTIVES AND TARGETS BEEN ESTABLISHED AND MAINTAINED?

0	1	2
No environmental management program has been developed.	In view of achieving the environmental objectives and targets, an environmental management program has been developed, including management procedures for some relevant functions and levels of the organization, but not for all. The environmental management program does not stipulate the means or timeframe for achieving its objectives and targets. A program was established, but has not kept pace with new developments or products in the organization.	The organization has established an environmental management program for achieving its objectives and targets, which describes how the organization's targets will be achieved ( <i>see Annex A to</i> <i>the Standard, A.4.3.4</i> ). The program identifies the personnel responsible for implementing the environmental policy and who is responsible for achieving the objectives and targets at each relevant function and level within the organization. The program includes the means available (e.g. financial, physical or human resources) by which the organization shall achieve its objectives and targets. The program has a clear timeframe which identifies what will be done or achieved by when and how. The environmental management program is amended where relevant to ensure that environmental management will be applied to new developments and new or modified activities, products or services. The environmental management program includes environmental reviews for new activities ( <i>see Annex A to the Standard,</i> <i>A.4.3.4</i> ).

### 4.4 Implementation and Operation

Principle 3: Implementation

"For effective implementation an organization should develop the capabilities and support mechanisms necessary to achieve its environmental policy, objectives and targets."

## 4.4.1.A HAVE ROLES, RESPONSIBILITY AND AUTHORITIES BEEN DEFINED, DOCUMENTED AND COMMUNICATED ?

0	1	2
Top management have not appointed (a) specific environmental management representative(s).	Top management have appointed (a) specific environmental management representative(s) but the roles, responsibilities and authority of this individual (these individuals) have not been defined or documented. Roles, responsibilities, and authorities of other operational management and staff functions for implementing the various elements of the environmental management system have been defined but have not been documented. The roles, responsibilities, and authorities of other operational management and staff functions have not been communicated to personnel.	Top management have appointed (a) specific environmental management representative(s). The environmental management representative(s) has a defined role, responsibility and authority for ensuring that the requirements of the environmental management system are established, implemented and maintained in accordance with the ISO 14001 standard and for reporting performance of the EMS to top management. Roles, responsibilities, and authorities of other operational management and staff functions for implementing the various elements of the environmental management system have been defined, documented and communicated to personnel in order to facilitate management. The environmental management representative reports on the performance of the environmental management to top management. These reports are used by top management to review the environmental management system and the basis for its improvement.

## **ANNEX I: FURTHER INFORMATION**

The following information is offered as further guidance for the development, implementation and checking of an organization's environmental management system. This information is derived primarily from the annex to ISO/DIS 14001 and from ISO/DIS 14004 - *Environmental management systems* - *General guidelines on principles, systems and supporting techniques.* Certain examples and hypothetical cases have been provided to illustrate the practical applications or implications of the principles elaborated in ISO/DIS 14004. These have been derived from various sources, including several commercially available information and training programs on EMS development and implementation, such as the "Environmental Management Systems Training Resource Kit" sponsored by UNEP, the ICC and FIDIC, both of which are based extensively on ISO/DIS 14001. Readers should bear in mind that the following information goes beyond a strict interpretation of the ISO standard and is intended to provide supplemental information and ideas on how an organization might satisfy the standard's requirements. It is not, and is not intended to be, an interpretation of the standard itself, and does not have the endorsement of ISO.

## PRINCIPLE 1: COMMITMENT AND POLICY

The environmental policy acts as the driving force for implementing and improving the organization's environmental management system so that it can maintain and potentially improve its environmental performance. Environmental policy is defined as a "statement by the organization of its intentions and principles in relation to its overall environmental performance which provides a framework for action and for the setting of its environmental objectives and targets." The environmental policy can have far-reaching business implications for the future direction of the enterprise. It should be integrated into the organization's overall business strategy and should also be compatible with other organizational policies such as quality, service, product stewardship or occupational health and safety. Once an environmental policy has been developed and published, the organization's environmental performance will be judged against it.

To ensure success, an early step in developing or improving an environmental management system is obtaining commitment from the *top* management of the organization to improve the environmental management of its activities, products or services. The ongoing commitment and leadership of the top management are crucial. The responsibility for developing the environmental policy should therefore rest with those at the very highest levels of the organization (e.g. Board of Directors) and it should be signed by the Chairman, Chief Executive or similar senior most manager as evidence of commitment. Top management may consist of an individual or group of individuals with executive responsibility for the organization.

Other levels of management will then be responsible for implementing the policy, but continuing support from the top of the organization will be needed during the further development of the environmental management system and for the organizational changes which will result from its implementation. To allow this, senior management should appoint someone from management to oversee the development and to implement the environmental policy. This person from management should also be provided the authority and means to do so.

An environmental policy establishes an overall sense of direction and sets the principles of action for an organization. It sets the overarching goal as to the level of overall environmental responsibility and performance required of the organization, against which all subsequent actions will be judged. It should reflect the organization's mission, vision, core values and guiding principles. It should also be based upon a full appreciation of the organization's environmental impacts and responsibilities.

## Formulating the policy

The organization's management is responsible for providing input to the formulation and modification of the policy and for implementing the policy. Guiding principles such as the "Rio Declaration on Environment and Development" or the "Business Charter for Sustainable Development" can assist the organization in developing its

policy. If the organization is part of any broader corporate body, top management should define and document its environmental policy within the context of the environmental policy of that broader corporate body of which it is a part and with the endorsement of that body. Other important sources of information for input into the environmental policy development process include the following:

- The organization's values and beliefs, such as (desired) relationship with its employees, the local community and the general public.
- The organization's business strategy and strategic plan: elements relating to the organization's (environmental) direction, opportunities and risks, medium and long term planning including internal and external limits and opportunities in capabilities and resources.
- Any existing statement on environmental aspects: mission statements, old policies, previous statements of commitment in internal/external reports.
- Other policies in existence such as occupational health and safety, or quality.
- The views of stakeholders (shareholders, employees) and other interested parties.
- Policy goals based on the initial environmental review.
- Legislation and regulations.
- Clear definition of the geographical and organizational scope of the policy: which facilities, departments, activities, services or products are to be covered by the environmental policy.
- General statements of environmental principles; e.g. from government, public bodies, industry associations, which are relevant to the organization.
- Examples of environmental policy statements from similar organizations.

The issues addressed in the policy depend on the nature of the organization. All activities, products or services can cause impacts on the environment. The environmental policy should recognize this. The organization's environmental policy cannot fully and adequately reflect the nature, scale and environmental impacts of its operations, products and/or services unless a conscious effort is made to assess these and their potential impacts on and/or implications for the environment. Therefore, some form of initial environmental review is an absolute necessity if the resulting policy will truly reflect the organization's sense of environmental responsibility (*See Section 4.3.1 Environmental Aspects*).

Taking into account the findings of such an initial review, the values and beliefs of the organization, its relationship with staff, neighbors, shareholders, customers and suppliers, regulators and other persons with an interest in how well the organization manages its environmental affairs, the organization will prepare and publicize its environmental policy, which will offer the broad environmental goals the organization intends to, or hopes to achieve.

An environmental management system is a dynamic tool. The environmental policy should direct the environmental management system to achieve improvements in overall environmental performance. The organization should begin where there is obvious benefit, for example, by focusing on regulatory compliance, by limiting sources of liability or by making more efficient use of materials.

As the organization grows in experience, and its environmental management system starts to take shape, procedures, programs and technologies can be put in place to further improve environmental performance. Then as the environmental management system matures, environmental considerations can be integrated into all business decisions.

The environmental policy forms the basis upon which the organization sets its objectives and targets. It should provide guidance. In ISO 14001, it is required that the environmental policy should explicitly include a commitment to comply with environmental legislation and regulations, and to other requirements to which the organization subscribes. This is a clear guidance to all persons involved in the organization that its activities should be carried out in compliance with environmental legislation and regulation. To have the greatest effect, it might be useful to identify, in the policy, the other requirements to which the organization subscribes, such as the

CMA or CEFIC "Responsible Care" initiative, or the ICC Business Charter for Sustainable Development, for example.

For public authorities in many countries, this clear commitment to compliance with environmental legislation and regulations in the frame of a certified environmental management system is an indication that the organization is taking environmental issues seriously. This will allow the public authorities to focus their attention on those companies who do not seem to take environmental issues seriously.

The policy forms the basis upon which the organization sets its objectives and targets. These will, in turn, be achieved through the implementation of the environmental management program. The objectives and targets should, like the policy, take account of the nature, scale and characteristics of the activities, products and services of the organization. Useful inputs for determining these objectives and targets might include a consideration of the current state and evolution of environmental legislation, private industry initiatives, the views of other interested parties (including perhaps even environmentalists and community leaders), as well as financial and other business considerations. Some organizations may start small, and initially go after objectives that bring immediate rewards at low cost (i.e., "low-hanging fruit"). Eventually, targets and objectives might include longer-term business or commercial opportunities.

The policy should be sufficiently clear to be capable of being understood by internal and external interested parties and should be periodically reviewed and revised to reflect changing conditions and information. Its area of application should be clearly identifiable.

In addition to compliance with environmental regulations, the policy can state commitments to:

- minimize any significant adverse environmental impacts of new developments through the use of integrated environmental management procedures and planning;
- · development of environmental performance evaluation procedures and associated indicators;
- embody life cycle thinking;
- design products in such a way as to minimize their environmental impacts in production, use and disposal;
- prevent pollution, reduce waste and the consumption of resources (materials, fuel and energy), and commit to recovery and recycling, as opposed to disposal where feasible;
- education and training;
- sharing environmental experience;
- involvement of and communication with interested parties;
- work towards sustainable development; and
- encourage responsible environmental behavior by suppliers and contractors.

## Publishing and distributing

It is important to ensure that the environmental policy becomes widely known and understood throughout the organization. The publishing and distribution of the environmental policy can provide an ideal opportunity for management to outline the underlying reasons for developing an environmental management system (for example in terms of business security, opportunities and risk reduction) and to explain to the staff how it will be implemented within the enterprise. This will help to encourage, at all levels, full commitment to achieving the environmental goals.

Internal presentation of the policy should precede the formal external publication. This will give staff the opportunity to familiarize themselves with the policy and to have questions answered. The publication of the policy will inevitably lead to questions from the staff such as "how will this affect my work". The opportunity to begin an ongoing dialogue with staff concerning environmental aspects should not be missed. Input and suggestions from staff towards meeting the policy objectives can provide the basis for motivating staff and encouraging their cooperation during the implementation stage of the environmental management system.

The publishing of the environmental policy is often the first public step into the environmental arena. Moreover, it can be an effective tool within the organization itself. It provides an ideal opportunity to explain to all of the staff the environmental direction of the organization and the reasons why this is necessary, to motivate them and encourage their involvement and cooperation.

As it is written for a wide audience, the style of the environmental policy should be concise. The information should be clearly formatted. It should be written in plain language that is accessible to and can be understood by all interested parties. The use of jargon, both environmental and technical, should be avoided.

There are many ways to publicize the environmental policy, largely depending on the size and resources of the enterprise. A brochure to give to interested parties, including the environmental authorities, members of the local community, etc. should be the minimum. Many companies also print their environmental policy in their annual (environmental) report, as well as post it prominently at the entrance to their facilities or offices. Of course, it is also possible to pay for commercial advertising if this is seen of benefit to the organization.

### Review of the environmental policy

In most organizations, the environmental policy is a relatively long-lived document, remaining unchanged for two or three years or even longer. However, it is necessary to ensure the continuing suitability of the policy on a regular basis. Changes might be necessary as a result of, for example:

- changing market situation;
- changes in processes, products, etc.;
- a merger with or acquisition of another organization; and/or
- the views of public and stakeholders.

It is important to include the review of the policy in the overall management review of the environmental management system (See Section 4.5 Environmental management system review) and to revise and adjust it as necessary.

## PRINCIPLE 2: PLANNING

## Identification of environmental aspects and impacts

An organization's policy, objectives and targets should be based on knowledge about the environmental aspects and significant environmental impacts associated with its activities, products or services. This can ensure that the significant environmental impacts associated with these aspects are taken into account in setting the environmental objectives. The relation between environmental aspects and impacts is one of cause and effect. An environmental aspect refers to an element of an organization's activity, which can have a beneficial or adverse effect on the environment. For example, it could involve a discharge, an emission, consumption or reuse of a material, or noise. An impact refers to the change which takes place in the environment as a result of the aspect. Examples of impacts might include contamination of water or depletion of a natural resource.

The identification of environmental aspects and the evaluation of environmental impacts is a process that can be dealt with in four steps:

- Step 1: Select an activity or process. (The selected activity or process should be large enough for meaningful examination and small enough to be sufficiently understood.)
- Step 2: Identify environmental aspects of the activity product or service. (Identify as many environmental aspects as possible associated with the selected activity or process.)
- Step 3: Identify environmental impacts. (Identify as many actual and potential, positive and negative, environmental impacts as possible associated with each identified aspect.)

Activity, product or service	Environmental Aspect	Environmental Impact
handling of hazardous materials	potential for accidental spillage	contamination of soil or water
product	reformulation of the product to reduce its volume	conservation of natural resources
vehicle maintenance	exhaust emissions	reduction of air pollution

Examples from the three steps are:

Step 4: Evaluate significance of impact. (The significance of each of the identified environmental impacts can be different for each organization. Quantification can aid judgment. Evaluation can be facilitated by considering environmental concerns (the scale of the impact, the severity of the impact, probability of occurrence, duration of impact) and business concerns (potential regulatory and legal exposure, difficulty of mitigating the impact, costs of mitigating the impact, effect of change on other activities and processes, concerns of interested parties, effects on public image of the organization).)

This section is intended to provide a process for an organization to identify significant environmental aspects that should be addressed as a priority by the organization's environmental management system. This process should take into account the cost and time of undertaking the analysis and the availability of reliable data. Information already developed for regulatory or other purposes may be used in this process. Organizations may also take into account the degree of practical control they may have over the environmental aspects being considered. Organizations determine what their environmental aspects are taking into account the inputs and outputs associated with their current and relevant past activities, products and services.

The identification of the environmental aspects is an ongoing process that determines the past, current and potential impact (positive or negative) of an organization's activities on the environment. This process also includes the identification of the potential regulatory, legal and business exposure affecting the organization. It can also include identification of health and safety impacts, and environmental risk assessment.

### Initial environmental review

An organization with no existing environmental management system should, as a first step, establish its current position with regard to environment by means of a review. The aim should be to consider all environmental aspects of the organization as a basis for establishing the environmental management system. Those organizations with operating environmental management systems do not have to undertake such a review.

The review should cover four key areas:

- a) legislative and regulatory requirements;
- b) an identification of significant environmental aspects;
- c) an examination of all existing environmental management practices and procedures;
- d) an evaluation of feedback from the investigation of previous incidents.

In all cases, consideration should be given to normal and abnormal operations within the organization, and to potential emergency conditions.

A suitable approach to the review may include checklists, interviews, direct inspection and measurement, results of previous audits or other reviews depending on the nature of the activities.

The process to identify the significant environmental aspects associated with the activities at operating units should consider, where relevant:

- a) emissions to air;
- b) releases to water;
- c) waste management;
- d) contamination of land;
- e) impact on communities;
- f) use of raw materials and natural resources;
- g) other local environmental issues.

The process should consider normal operating conditions, shut down and start up conditions, as well as realistic potential significant impacts associated with reasonably foreseeable or emergency situations.

The process is intended to identify significant environmental aspects associated with activities, products or services, and is not intended to require a detailed life cycle assessment. Organizations do not have to evaluate each product, component or raw material input. They may select categories of activities, products or services to identify those aspects that are likely to have a significant impact.

The control and influence over the environmental aspects of products vary significantly, depending on the market situation of the organization. A contractor or supplier to the organization may have comparatively little control, while the organization responsible for product design can alter the aspects significantly by changing for example a single material input. While recognizing that organizations may have limited control over the use and disposal of their products, they should consider, where practical, proper handling and disposal mechanisms. This provision is not intended to change or increase an organization's legal obligations.

### Keeping track of legal and other requirements

The organization should establish and maintain procedures to identify, have access to and understand all legal and other requirements to which it subscribes, directly attributable to the environmental aspects of its activities, products or services.

To maintain regulatory compliance, the organization should identify and understand regulatory requirements applicable to its activities, products or services. Regulations can exist in several forms:

- those specific to the activity (e.g., maximum emission or discharge limitations);
- those specific to the organization's products or services (e.g. for a packaging producer; restrictions on the use of certain chemicals or requirements with regard to discarded packaging take-back);
- those specific to the organization's industry;
- general environmental laws; and
- authorizations, licenses and permits.

Several sources can be used to identify environmental regulations and ongoing changes, including all levels of government; industry associations or groups; commercial databases; and professional services.

To facilitate keeping track of all legal requirements, an organization can establish and maintain a profile or compilation of all laws and regulations pertaining to its activities, products or services. Mention in the documentation the date of the latest amendment to the law or regulation you are aware of.

Examples of other requirements to which the organization may subscribe are:

- industry codes of practice (e.g., "Responsible Care", etc.);
- standards (ISO 14001, EMAS, ISO 9000,...);
- agreements with public authorities (e.g. "environmental covenants", 33/50, etc.);
- eco-label requirements for products (e.g., "blauer engel", "marque retour"; etc.); and
- non-regulatory guidelines (e.g., ICC Business Charter for Sustainable Development, etc.).

Internal priorities and criteria should be developed and implemented where external regulatory and other requirements do not meet the needs of the organization or are non-existent. Internal performance criteria, together with external standards, assist the organization in developing its own objectives and targets. Examples of areas where an organization can have internal performance criteria might include:

- management systems;
- employee responsibilities;
- acquisition, property management and divestiture;
- suppliers;
- contractors;
- product stewardship;
- environmental communications;
- regulatory relationships;
- · environmental incident response and preparedness;
- environmental awareness and training;

- environmental measurement and improvement;
- process risk reduction;
- prevention of pollution and resource conservation;
- capital projects;
- process change;
- hazardous material management/substitution;
- waste management;
- water management (e.g., waste, storm, ground);
- air quality management;
- energy management; and transportation.

#### Setting objectives and targets

The environmental policy is not an end in itself. The environmental policy has to be used together with the results of the environmental review, to develop detailed objectives and targets. Objectives should be established to meet the organization's environmental policy. These objectives are the overall goals for environmental performance identified in the environmental policy. When establishing its objectives an organization should also take into account the relevant findings from environmental reviews, and the identified environmental aspects and associated environmental impacts. In reviewing and analyzing this information, one has to identify priorities (e.g. a situation of non-compliance which puts the whole operation at risk has to be addressed first). Identify the issues of vital

importance, high priority, medium priority, and low priority. In setting objectives first address the issues with the highest priority.

Environmental targets can then be set to achieve these objectives within a specified time-frame. The targets should be specific and measurable.

When the objectives and targets are set, the organization should consider establishing measurable environmental performance indicators. These indicators can be used as the basis for an environmental performance evaluation system and can provide information on both the environmental management and the operational systems.

Objectives and targets can apply broadly across an organization or more narrowly to site-specific or individual activities. Appropriate levels of management should define the objectives and targets. Objectives and targets should be periodically reviewed and revised, and should take into consideration the views of interested parties.

When establishing the objectives and targets, the possibility of taking preventative measures have to be considered, as well as the legal and other requirements, the significant environmental aspects, the technological options, and the financial, operational and business requirements, and the views of interested parties. Taking into consideration the financial requirements of the organization does not imply that environmental cost accounting methodologies should be used.

When considering the technological options, one may consider the use of best available technology where economically viable, cost effective and judged appropriate.

Objectives can include commitments to:

- reduce waste and the depletion of resources;
- reduce or eliminate the release of pollutants into the environment;
- design products to minimize their environmental impact in production, use and disposal;
- control the environmental impact of raw material sourcing;
- · minimize any significant adverse environmental impact of new developments; and
- promote environmental awareness among employees and the community.

Progress towards an objective can generally be measured using environmental performance indicators such as:

- quantity of raw material or energy used;
- quantity of emissions such as CO<sub>2</sub>;
- waste produced per quantity of finished product;
- efficiency of material and energy use;
- number of environmental incidents/accidents;
- percentage of waste recycled;
- percentage recycled material used in packaging;
- number of vehicle kilometers per unit of production;
- specific pollutant quantities (e.g. NOx, SO2, CO, HC, Pb, CFCs);
- investment in environmental protection;
- number of prosecutions; and
- land area set aside for wildlife habitat.

An integrated example		
Policy	Commitment to regulatory compliance	
Environmental review	Permit requirements with regard to air emissions are often violated, due to high fuel consumption in manufacturing	
Prioritizing	Regulatory authorities threatened to stop the manufacturing if no action was taken - high priority	
Objective 1	reduce energy required in manufacturing operations	
>> Target	achieve 10% reduction of the previous year	
>> Indicator	quantity of fuels per unit of production.	

#### **Environmental Action Program**

The translation of the policy into action takes the form of an environmental action program. Within the general planning of activities, an organization should establish an environmental action program, that addresses all of its environmental objectives. To be most effective the environmental action planning should be integrated into the organization's strategic plan. Environmental action programs should address schedules, resources and responsibilities for achieving the organization's environmental objectives and targets.

Within the framework provided by the environmental planning, an environmental action program identifies specific actions in order of their priority to the organization. These actions may deal with individual processes, projects, products, services, sites or facilities within a site.

Environmental action programs help the organization to improve its environmental performance. They should be dynamic and revised regularly to reflect changes in organizational objectives and targets.

The creation and use of (a) program(s) is a key element to the successful implementation of an environmental management system. The program should describe how the organization's targets will be achieved, including time-scales and personnel responsible for implementing the organization's environmental policy. This program may be sub-divided to address specific elements of the organization's operations. The program should include an environmental review for all new activities.

The program may include, where appropriate and practical, consideration of planning, design, production, marketing and disposal stages. This may be undertaken for both current and new activities, products or services. For products this may address design, materials, production, processes, use and ultimate disposal. For installations or significant modifications of processes this may address planning, design, construction, commissioning, operation and, at the appropriate time determined by the organization, decommissioning.

Underneath you will find a fictive example of an environmental action program of "Testbull Inc.". It is divided into two parts. The first table gives an overview of the environmental action program of the organization as a whole. Each of the action items is further detailed in the department environmental action program.

	1996 Environmental Action Program Testbull Inc.				
N°	What Budget Who Time schedule				
1.	Water treatment installation	US\$ 30,000	John Hooker Process Engineer	Dec. 1996	
2.	Selective waste collection	US\$ 1,000	Alice Wonderland Environment Coord.	May 1996	
3.	Worker environment awareness training	US\$ 2,000	Human Resources Department	Sept Dec. 1996	
4.					

	1996 Environmental Action Program					
Process Engineering Department Testbull Inc.						
N°	What	Budget	Who	Time schedule		
1.	Water treatment installation	US\$ 30,000	John Hooker Process Engineer	Dec. 1996		
1.1	Investigate various design possibilities	-	Chris	January		
1.2	Obtain quotes for construction of selected installation	-	Sarah	February		
1.3	Select construction company	-	Department Meeting	1 March		
1.4	Supervise construction activities	-	Gilbert	March - June		
1.5	Testing the installation	-	Patrick	July		
1.6	Inauguration of installation	US\$ 1,000	Tom & Marketing Dept.	August		
1.7	Recruiting installation guard	-	John & Human Resources Department	May

## **PRINCIPLE 3: IMPLEMENTATION AND OPERATION**

The successful implementation of an environmental management system calls for the commitment of all employees of the organization. Environmental responsibilities therefore should not be seen as confined to the environmental function, but may also include other areas of an organization, such as operational management or staff functions other than environmental.

### **Responsibilities and Accountabilities**

The commitment of all employees to the successful implementation of an environmental management system should begin at the highest levels of management. Top management should establish the organization's environmental policy and ensure that the environmental management system is implemented. As part of this commitment, top management should designate (a) specific management representative(s) with defined responsibility and authority for implementing the environmental management system. In large or complex organizations there may be more than one designated representative. In small or medium sized enterprises, these responsibilities may be undertaken by one individual.

It is also important that the key environmental management system responsibilities are well defined and communicated to personnel. People should know whose job it is to do what. The organizational structure usually consists of four main elements: the organizational chart, job descriptions, clear reporting lines and procedures, and performance targets. The organizational chart visualizes the organizational structure, main responsibilities and reporting lines. Issues that could be considered in developing the organizational structure are:

- provision of resources;
- action to prevent non-compliance;
- identifying potential problems;
- · recommending solutions to problems and verifying their implementation; and
- acting in emergency situations.

It is often recommended that the environmental management responsibilities should follow the operational hierarchy, so that it becomes part of the everyday management of running the enterprise. The environmental manager should be responsible, either directly or by managing others, for ensuring that the environmental management system is established, implemented and effective. Top management should ensure that an appropriate level of resources are provided to ensure that the environmental management system is implemented and maintained.

### Training and Communications

To be successful, responsibilities should be supported by the necessary authority and training to enable the individuals to carry out their tasks effectively. An effective and on-going training program is necessary for all levels of the organization to ensure awareness of environmental issues. Training needs have to be assessed taking into account the job to be carried out, and the skills, education and experience of the individuals in charge. Training should instruct on the organization's environmental policy, objectives and action program. It should address the significant environmental impacts, actual or potential, and the environmental benefits of improved personal performance. Equally, it should highlight the potential consequences of departure from specified operating procedures. A successful training program is an interactive process that provides the participants with information, awareness, knowledge, understanding and motivation. This interactive process requires managers to respond to suggestions and initiatives raised pursuant to the training sessions. Even if the suggestions are not appropriate, they need to be treated seriously so that the initiative and impetus of the training is maintained. The benefits of training can be quickly lost if the employees feel that the training is carried out in a vacuum, and that

on the workfloor managers are not interested in their attempts to apply new found knowledge and understanding. Complete records of all training provided and who participated in it, should be maintained.

To maintain a certain dynamic in the environmental management system, proper internal and external communication procedures are essential. Such a procedure may include a dialogue with interested parties and consideration of their relevant concerns. In some circumstances responses to interested parties' concerns may include relevant information about the environmental impacts associated with the organizations operations. These procedures should also address necessary communications with public authorities regarding emergency planning and other relevant issues.

#### Documentation

The environmental documentation may be integrated and shared with documentation of other systems implemented by the organization, e.g. quality control and safety procedures. It does not have to be in the form of a single manual.

Environmental records may include:

- a) organizational charts;
- b) internal standards and operational procedures;
- c) site emergency plans;
- d) information on applicable environmental laws and other requirements;
- e) complaint records;
- f) training records;
- g) product process information;
- h) product information;
- i) inspection, maintenance and calibration records;
- j) pertinent contractor and supplier information;
- k) incident reports;
- l) information on emergency preparedness and response;
- m) records on significant environmental impacts;
- n) audit results; and
- o) management reviews.

Proper account should be taken of confidential business information.

The procedures for identification, maintenance and disposition of records should focus on those records needed for the implementation and operation of the environmental management system, as well as those records needed to record the extent to which planned objectives and targets have been met.

The intent of the document control procedures is to ensure that organizations create and maintain documents in a manner sufficient to implement the environmental management system. However, the primary focus should be on the effective implementation of the environmental management system and on environmental performance, and *not* on a complex documentation control system.

#### Procedures

Carefully written procedures are the basis for implementing the environmental management system. Procedures should specify who is to carry out what tasks, give step-by-step instructions for how tasks are to be accomplished, and include directions for dealing with departures from the procedures. Setting and maintaining effective environmental procedures involves five stages: identifying environmental aspects, assessing potential environmental impacts, identifying risk control measures, preparing and maintaining procedures to maintain control; and ongoing audit and review of these procedures. The operating procedures and controls should include, where appropriate, consideration of accidental emissions to atmosphere; accidental discharges to water and land; and specific environment and ecosystem effects from accidental releases.

The emergency plans can include:

- emergency organization and responsibilities;
- a list of key personnel;
- details of emergency services (e.g. fire department, spill clean-up services);
- an internal and external communication plan;
- actions taken in the event of different types of emergencies;
- information on hazardous materials, including each material's potential impact on the environment, and measures to be taken in the event of accidental release; and
- training plans and testing for effectiveness.

## PRINCIPLE 4: CHECKING AND CORRECTIVE ACTION

Measuring, monitoring and evaluating are key activities of an environmental management system, to ensure that the organization is performing in accordance with the environmental policy, objectives and action program.

In establishing and maintaining procedures for investigating and correcting non-conformance, the organization should include the following basic elements:

a) identifying the cause of the non-conformance;

b) identifying and implementing the necessary corrective action;

c) implementing or modifying controls necessary to avoid repetition of the non-conformance; and

d) recording any changes in written procedures resulting from corrective action.

Audits may be performed by personnel from within the organization or by external persons selected by the organization. In either case the persons conducting the audit should be in a position to do so impartially and objectively.

## PRINCIPLE 5: MANAGEMENT REVIEW

The organization should review and continually improve its environment management system, to achieve overall improvement in environmental performance. At regular intervals management should carry out a review of the environmental management system to ensure its continuing suitability and effectiveness.

The scope of the review should be comprehensive, though not all elements of an environmental management system need to be reviewed at once and the review process may take place over a period of time.

Some issues to be considered in the review are:

- review of the environmental objectives and targets;
- audit findings;
- · concerns amongst relevant interested parties; and
- evaluation of the effectiveness of the environmental management system;
- evaluation of the suitability of the environmental policy and the need for changes in the light of changing legislation, changing expectations and requirements of interested parties, changes in the products or activities of the organization, developments in technology, lessons learned from environmental incidents, market preferences, reporting and communication.

## ANNEX II: RELATIONSHIP BETWEEN THE ICC BUSINESS CHARTER PRINCIPLES AND THE ELEMENTS FOUND IN ISO 14001

ICC Principles	ISO 14001
1. Corporate Priority	•
